

Technical data | TES heavy-load series

By combining the most advanced precision manufacturing as well as using premium materials, we have created an extremely durable and easy-to-maintain gearbox. The modular gearbox design enables the individual planetary stages to be supported individually. This also strongly reduces the operation-related wear and significantly increases the service life of the gearbox

- Available from 200 to 12,000 Nm
- Freely rotatable gearbox
- Fast and precise
- 2-speed gear box right/left
- 200 torque settings
- Stored module construction for continuous use
- Are fitted with a torque cutoff system, giving an accuracy of +/- 3.5% under unchanging conditions
- Are fast, precise and safe and make little noise
- Are available in 230 volt and 110 volt versions
- Newly designed drive motor characterized by its robust and easy-to-maintain design as well as its high power reserves.
- Has clockwise and counterclockwise rotation as well as a 2-speed gearbox and can be adjusted to 200 different torque ranges
- Free positioning of the control unit; the drive motor can rotate freely around 360° - this allows the device to be comfortably positioned on the screw connection
- Can be optionally equipped with a load activation. This allows the twist occurring between the slip nut and support to be independently released. During this process, the drive motor turns in the reverse direction for a short time. This option is essential for short installation times and offers an ultimate degree of safety.
